INDOOR POST INSULATORS

APPLICATION

Epoxy cast resin indoor post insulators can be used for all indoor applications. For tropical conditions same types (with special fixing parts) are available. They are suitable for temperatures from -25° up to +90°C.

CONSTRUCTION

Epoxy cast resin indoor post insulators are cylindrical solid insulators, with proper creepage and number of ripples. The main dimensions are in accordance with IEC 60273 -1990. Auxiliary inserts are connected with main insert electrically.

TESTS

The following tests, according to IEC 60660 - 1999 are performed:

ROUTINE TESTS

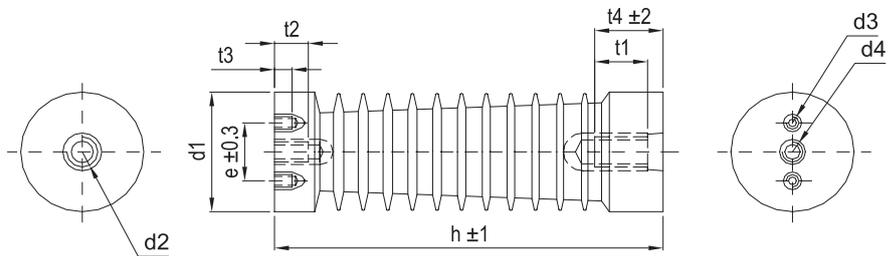

- Visual inspection
- Testing of conductive connection of fixing inserts for post insulators type B (IEC 60660 -1999)
- Power-frequency withstand voltage (dry)
- Partial discharge measurement

SAMPLE TESTS

- Testing of minimum failing load for bending

ADDITIONAL TESTS

- Lightning impulse withstand voltage test (on request)
- Testing of minimum failing loads (nominal loads) for bending

Um: Highest voltage for equipment

CAPACITIVE DIVIDER INSULATORS

NECESSARY INFORMATION FOR ORDERING:

- 1- Voltage detecting system: HR or LRM system.
- 2- Nominal voltage, U_n (if different from U_m).
- 3- Length of the coaxial cable for connection.
- 4- If the capacitance of the indicator is different from IEC 61243-5, please inform us about the capacitance of the indicator.

APPLICATION

Indoor voltage divider insulators are used for the detection of the presence of voltage on phase lines. The basic operation principle is on the capacitive division of phase voltage. The voltage divider insulators are used with capacitance coupled voltage indicating system. They are suitable for temperatures from -25°C up to $+90^{\circ}\text{C}$.

CONSTRUCTION

Indoor voltage divider insulators are epoxy cast resin. The main dimensions and mechanical requirements are in accordance with DIN 48136.

TESTS

In addition to the tests applied to the standard insulators according to VOE 0441 part 3 (1984)

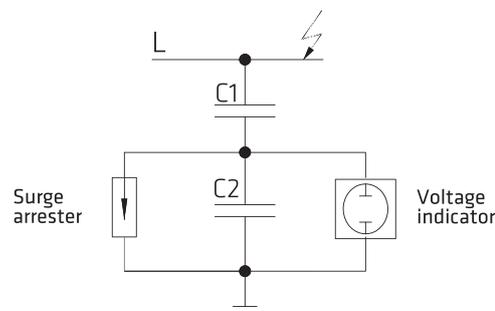

IEC 60660-1999 FOLLOWING ROUTINE TESTS ARE PERFORMED:

- Power-frequency withstand voltage test [dry]
- Partial discharge measurement
- Capacitance test

CAPACITIVE VOLTAGE INDICATING SYSTEM FOR MEDIUM VOLTAGE

Capacitance-coupled voltage indication system

The voltage indication system consists essentially of a capacitive voltage divider between a conductor L and earth. Moreover, the system includes an indicator for the detection of voltage and a surge arrester for protection purposes.

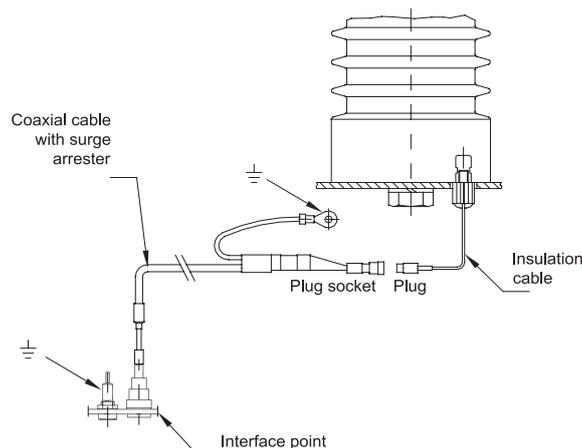

Function

Voltage division occurs due to the capacitive values of C_1 and C_2 . According to IEC 61243-5 the indication should start in between 10 % of the rated voltage of the system. For that reason, the capacitance values are adjusted in accordance within this range so that the indication starts. Up to 10% of the rated voltage, there shall be no indication. Under any circumstance above 45% of the rated voltage the indication shall be "ON".

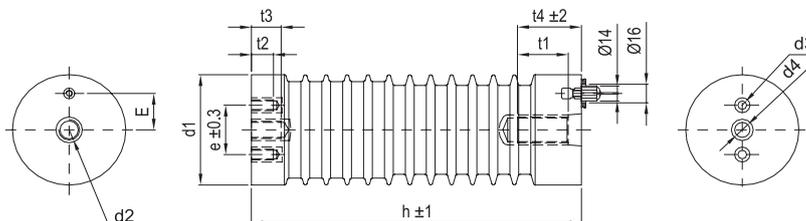

The presence of voltage is indicated separately and independently for each phase conductor. The system operates without a battery or auxiliary supply. The energy required for the system is being drawn from the high voltage system (OVI system may require auxiliary power for some additional functions depending on the application).

Shock hazard protection

Voltage indication system does not present any risk during normal or disturbed operation. During normal operation, the voltage divider capacitance C_1 limits the currents to less than $100\mu\text{A}$.
